Always construct drawer boxes 1 1/16" smaller than the cabinet opening.

The breathing tabs allow the slide to adapt to variances in construction and materials. If you use the hole at the base of the tab or any other non-breathing tab mounting hole, it anchors the slide member to the cabinet and does not allow the breathing tabs to do their job.

Always reference the technical sheet for the correct dimensions for your construction method.

When inserting the drawer, first be sure the ball bearing retainers in the cabinet member are fully forward. Insert the drawer member into the cabinet member. Push the drawer in until it is completely closed; the Easy-Close mechanism will click and engage.

Cycle the drawer two or three times.
